

Serial No. 10/781157

- 3 -

Art Unit: 2665

In the claims:

1. (currently amended) A method for use by a wireless device in a wireless communications environment, the method comprising the steps of:

associating the wireless device with a current access point on one a first channel;

ascertaining, by the wireless device, whether the wireless device should attempt to associate with an alternative access point operating on a second another channel, the ascertaining based at least in-part on signal strengths of transmissions from the current and alternative access points; and

requesting association with the alternative access point operating on another channel if it is ascertained that the wireless device should attempt to associate with said alternative access point.

2. (currently amended) The method of claim 1 further comprising the step of:

automatically collecting, by the wireless device, information about access points operating on other channels.

3. (currently amended) The method of claim 2 wherein the step of ascertaining ascertains that the wireless device should attempt to associate with the alternative another access point operating on said ~~different~~ second channel if the alternative access point on said ~~different~~ second channel is closer than the current access point.

4. (currently amended) The method of claim 3 wherein the step of ascertaining ascertains that the alternative access point on said ~~different~~ second channel is closer than the current access point by:

Serial No. 10/781157

- 4 -

Art Unit: 2665

calculating a first biased distance between the wireless device and the current access point based on "x" samples;

calculating a second biased distance between the wireless device and the alternative access point operating on said ~~different~~ second channel based on "y" samples where "y" is less than "x";  
and

ascertaining that the alternative access point operating on said ~~another~~ second channel is closer than the current access point if the second biased distance is less than the first biased distance.

5. (currently amended) The method of claim 3 wherein the step of requesting association requests association by sending a message to the access point operating on said ~~another~~ second channel.

6. (new) A method for use by a wireless device in a wireless communications environment, the method comprising the steps of:

associating the wireless device with a first access point on a first channel;

determining, by the wireless device, whether a second access point would provide a better data rate than the first access point; and

requesting, by the wireless device, association with the second access point if it is determined that the second access point would provide a greater data rate than the first access point.

7. (new) The method of claim 6 wherein the second access point operates on the first channel.

Serial No. 10/781157

- 5 -

Art Unit: 2665

8. (new) The method of claim 6 wherein the second access point operates on a second channel.
9. (new) The method of claim 6 wherein the determining step is based at least in-part on signal strength of transmissions from the first and second access points.
10. (new) The method of claim 6 wherein the determining step is based at least in-part on an indication of loading advertised by the first and second access points.
